PHS Type	Operation Mode	Occasions when the PHS type operates
Pluri-annual Pumped-Storage (PAPHS)	Pump	Annual surplus in hydroelectric generation [22].
		Annual fuel prices cheaper than average.
		Lower than average annual electricity demand [32].
	Generation	Annual deficit in hydroelectric generation [22].
		Annual fuel prices more expensive than average.
		Higher than average annual electricity demand [32].
Seasonal Pumped-Storage (SPHS)	Pump	Rainy seasons or ice melting seasons, with high hydropower generation [33].
		Summer, with high solar power generation [23].
		Windy seasons, with high wind power generation [34,35].
		Low demand season, when electricity demand reduces.
	Generation	Dry period or freezing winters, with low hydropower generation [33].
		Winter, with low solar power generation [23].
		Not windy seasons, with low wind power generation [34,35].
		High demand season, when electricity demand increases.
Weekly Pumped-Storage (WPHS)	Pump	During the weekends, when power demand reduces [36].
		Windy days, with high wind power generation [35].
		Sunny days, with high solar power generation [4].
	Generation	During weekdays, when power demand increases [36].
		Not windy days, with low wind power generation [35].
		Cloudy days, with low solar power generation [4].
Daily Pumped-Storage (DPHS)	Pump	Night, when electricity demand reduces [37].
		Day, when there is solar power generation [38].
	Generation	Day, when electricity demand increases [37].
		Night, when there is no solar power generation [38].
Hourly Pumped- Storage (HPPS)	Pump & Generation	Ancillary services: frequency control, remove harmonics in the grid, provide backup power in case of disturbances in supply.
